                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         releasing hormone (GnRH) tetramer (W03944), in which the 4 GnRH repeat units are separated by spacers designed to increase immunogenicity. The DNA sequence was incoporated into vector pAa352 (ATCC 68283), which contains a truncated leukotoxin gene (LKT 352) derived from Pasteurella haemolytica, to give plasmid pCB113 (T37176). Escherichia coli transformants produce an LKT-GnRH fusion protein (see also W03942 and W03943) useful as a vaccine for fertility control of domestic or farm animals.
             contains substitutions at amino acid residues 15 and 41, whereby His replaced by Asp. This produces an alternating multimeric GnRH seque which is highly immunogenic that can be used in the construction of chimeric protein that comprises a leukotoxin polypeptide, several multimers, and the GnRH sequence. The chimeric protein can be used
                                                                                                                                                                                                                                                                 Chimeric protein of leukotoxin and gonadotropin releasing useful for, e.g. preparation of vaccines for reduction of of mammary tumours in mammals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gonadotropin releasing ho

                                      This represents the amino acid sequence of the gonadotrophin releasing Concorne (GRRH-2) decapeptide fragment used in the chimeric leukotoxin-GC GnRH polypeptide gene fusions. This is used to exemplify the method of invention of immunisation against endogenous molecules by administering CC a vaccine which comprises an immunogen and a carrier to the ear of the commandal. The method is useful for eliciting an efficient and uniform immune response to block or suppress the activity of an endogenous can be come to block or suppress the activity of an endogenous cell type CC or to elicit an immune response against a targeted endogenous cell type CC (e.g. a cancerous or otherwise diseased cell). It is especially useful CC or reduce the levels of GRRH indomestic animals, especially in porcine CC levels of luteinizing hormone and follicle stimulating hormone and helps in immunocastrating the animal. Administration of vaccine compositions to the ear instead of intramuscular administration into the neck increases the efficiency of vaccination of mammals against endogenous immunogens,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                        This sequence represents a four-copy gonadotropin-releasing hormone (GnRH) multimer, where the second and fourth GnRH sequence. have a His to Asp substitution at position 2 of the GnRh sequence. The invention relates to GnRH immunogens, analogues or antibodies that cross-react with endogenous GnRH of a vertebrate. A specifically claimed immunogenic fusion protein (Y58361) comprises, in the N to C-terminal direction, a synthetic peptide sequence (Y58364), an eight copy GnRH multimer (composed of two copies of the 4xGnRH multimer protein), and a second eight copy GnRH multimer. The fusion protein mabe used in a vaccine composition for prepubertal administration to a vertebrate subject to result in prolonged suppression of reproductive
                        and/or function in males, or a prolonged, long-term suppression of ovarian development and/or function in females. The methods provide a viable and desirable alternative to surgical forms of sterilisation ti
                                                                   behaviour and/or fertility. GnRH immunogens, analogues or antibodies are used to manufacture a composition or vaccine for immunosterilisation or immunocontraception of feline, canine, equine or cervine subjects. The vaccines are used to suppress reproductive behaviour and/or fertility for at least 10 months. The prepubertal administration results in a prolonged, long-term suppression of testicular development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence

Sequence
                                                                                                                                                   This sequence represents four copies of a gonadotropin releasing hormone (GnRH) analogue, DNA encoding which was used in the construction of a chimeric GnRH-leukotoxin (LKT) fusion gene (246400). This fusion gene encodes a GnRH-LKT fusion protein which may be used as a vaccine. The LKT portion of the protein acts to enhance the immunogenicity of the GnRH portion. The invention relates to a method of using two GnRH immunogen vaccines to produce uncastrated male animals for meat production, one vaccination prior to or during the fattening period to reduce circulating testosterone levels, and the second vaccination about 2-8 weeks before slaughter to
                                                                         and muscle/fat distribution of male animals without the problems associated with male animals. Such problems include "boar taint", urine-like odour found in cooked meat of uncastrated pigs which is
                                more reliable
                                                                                                                     substantially reduce androgenic and/or non-androgenic steroids. The invention is used to produce food animals that exhibit the weight gain
                                                                                                                                                                                                                                                                                                                          Example 1; Fig 2B; 87pp; English.

                                                                                                                 Plasmid pBTA735 is a TraTp-LHRH analogue fusion in which the LHRH analogue has been inserted between amino acids 101 and 102 of TraTp (Ogata R.T. et al., (1982) J.Bacteriol. 151:819-827). The synthetic LHRH analogue was inserted via a linker which provides a unique new SmaI site located between codons such that the LHRH is inserted in frame. The fusion protein can be used in vaccines for the inhibition or control of reproduction in vertebrates, where the TraTp acts as an adjuvant.

                                                                                                                                                                                                                               Plasmid pBTA740 is a TraTp-LHRH analogue fusion in which the LHRH analogue has been inserted between amino acids 236 and 237 of TraTp (Ogata R.T. et al., (1982) J.Bacteriol. 151:819-827). The synthetic LHRH analogue was inserted via a linker which provides a unique new Smal site located between codons such that the LHRH is inserted in frame. The fusion protein can be used in vaccines for the inhibition or control of reproduction in vertebrates, where the TraTp acts as an adjuvant.
                                                                                                                                                                                                                                                                                                                                                                   Fusion

It is the product of a chimeric gene (T3717) produced by deleting an approx. 1300 bp sequence from pCB13 (see also T37176) coding for amino acids 352-784 of LKT-352. Recombinant plasmid pCB111 (LKT 111:4 copy GnRH, ATCC 69748) was obtd. Escherichia coli transformants produced the chimeric protein, which is useful as a vaccine for fertility

The removal of this region also enables the truncated LKT to be expressed at much higher levels and allows the amount of antigen administered to be reduced. This chimeric protein comprises a leukotoxin polypeptide, several multimers, and a GnRH sequence. The chimeric protein can be used as a vaccine to help reduce the incidence of mammary tumours in a mammalian individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chimeric protein of leukotoxin and gonadotropin releasing useful for, e.g. preparation of vaccines for reduction of of mammary tumours in mammals

This plasmid contains the LKT 111 polypeptide fused to sixteen copies of the GnRH peptide, in the pattern of: 8 copies of GnRH-LKT 111-8 copies of GnRH. This chimera lacks cytotoxic activity which enables there to be an increase in antigen presentation and thus an optimal immune response. The removal of this region also enables the truncated LKT to be expressed at much higher levels and allows the amount of antigen administered to be reduced. This chimeric protein comprises a leukotoxin polypeptide, several multimers, and a GnRH sequence. The chimeric protein can be used as a vaccine to help reduce the incidence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    useful for, e.g. preparation of vaccines for of mammary tumours in mammals

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New anti-gonadotropin releasing hormone immunogenic composition(s) - used for treating gonadotropin and gonadal steroid hormone dependent disease(s) and providing contraception.
Manns JG,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gonadotropin releasing hormone (GnRH). These peptides comprise the wild type GnRH sequence and a spacer attached to either the N- or C-terminal. The spacer molecules serve as a link through which the immunomimic is attached to an immunological carrier such as diphtheria toxoid (DT) and also affects the immune response generated by the vaccinated mammal against the immunomimic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in R78282-85 represent immunomimetics to gonadotropin releasing hormone (GnRH). These peptides comprise the wild type GnRH sequence and a spacer attached to either the N- or C-terminal. The spacer molecules serve as a link through which the immunomimic is attached to an immunological carrier such as diphtheria toxoid (DT) and also affects the immune response generated between the content of the content 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   by the vaccinated mammal against the immunomimic. Compositions comprising these peptides may be used for treating a mammal for gonadctropin and gonadal steroid hormone associated dependent disease or for providing immunological contraception in mammals. They can also be used for treating breast cancer, uterine and other gynaecological cancers, endometriosis, uterine fibroids, prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 1; Page 29; 39pp; English.

cc ability to stimulate an anti-self response provides a simple alternative cc to physical castration, as it does not result in any of the detrimental cc side effects associated with physical castration. Other examples of cc diseases and conditions treated with self proteins fused with ubiquitin care TNF and its epitopes to modulate septic shock, arthritis, ig cc enilammatory bowel disease, Crohn's disease, and ulcerative colitis; ig cc egsilon heavy chain for the control of allergic reactions; chorionic cc gonadotropin for fertility control; and sperm proteins for fertility control. A further use of the fusion proteins is as part of a vaccine to control. A further use of the fusion proteins is as part of a vaccine to shipment to market. In addition, the fusion proteins of the invention cc can be used to detect and identify antibodies from experimental samples. This sequence represents a GNRH dimer used in the construction of a cc ubiquitin fusion protein described in the method of the invention. Query Match Best Local s Matches 9 generation of anti-gonadotropin releasing hormone antibodies which result in the suppression of luteinizing hormone and follicle stimulating hormone. This indirectly suppresses steridogenesis and gamete maturation in males and females. This type of anti-self response in humans is useful in the treatment of prostate cancer and breast cancer. In livestock, the This invention describes a novel fusion protein, comprising a heat shock protein (e.g. ubiquitin), fused to an epitope(s) in a defined manner which is useful for the stimulation of a highly specific immune response when administered to an animal. The protein of the invention may be post-translationally modified (e.g. by the addition of fatty acids to enhance immunogenicity). The fusion proteins of the invention can be used as vaccines to induce an immune response. When a T cell epitope is attached, they can be used for control of viral infections, bacterial infections, parasitic infection and cancer. The fusion proteins can be used in pharmaceutical compositions for the treatment of gastrointestinal diseases, pulmonary inflections, respiratory inflections, and HIV infections. The use of ubiquitin as a scaffold is also useful for the presentation and stimulation of anti-self immune responses, e.g. Sequence Example 3; Page 40; 67pp; English. This invention describes a novel fusion protein, comprising a heat shock protein (e.g. ubiquitin), fused to an epitope(s) in a defined manner cwhich is useful for the stimulation of a highly specific immune response when administered to an animal. The protein of the invention may be composed immunogenicity). The fusion proteins of the invention can be considered, they can be used for control of viral infections, bacterial infections, parasitic infections and cancer. The fusion proteins can be used in pharmaceutical compositions for the treatment of gastrointestinal diseases, pulmonary inflections, respiratory inflections, and HIV confections. The use of ubiquitin as a scaffold is also useful for the presentation and stimulation of anti-self immune responses, e.g. composed in males and females. This type of anti-self response in humans is useful in the suppression of luteinizing hormone and follicle stimulation in males and females. This type of anti-self response in humans is useful in the treatment of prostate cancer and breast cancer. In livestock, the ability to stimulate an anti-self response provides a simple alternative to physical castration. Immunocastration of pigs is a better alternative to physical castration, as it does not result in any of the detrimental side effects associated with physical castration. Other examples of the physical castration for proteins fused with ubiquitin are TNF and its epitopes to modulate septic shock, arthritis, if ception heavy chain for the control of allergic reactions; chorionic control. A further use of the fusion proteins is as part of a vaccine to

              The peptide comprises at least 2 LHRH sequences in tandem. The peptide can be used to vaccinate mammals (e.g. pigs) against LHRH. Such vaccination is used in human medicine for the treatment of prostate cancer and breast cancer and some forms of hypophyseal carcinoma. Other applicns, include sterilisation of domestic animals and treatment of aggression in dogs. A major use of the vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding "boar vaccination is to improve meat quality in pigs by avoiding the pigs by avoiding the pigs by avoiding th

In addition, the fusion proteins of the invention can be used to detect and identify antibodies from experimental samples This sequence represents a GnRH mixed dimer used in the construction of a ubiquitin fusion protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

     may be a spacer gp. between Gly(20) and Gln(21). The peptide can be used to vaccinate mammals (e.g. pigs) against LHRH. Such vaccination is used in human medicine for the treatment of prostate cancer and breast cancer and some forms of hypophyseal carcinoma. Other applicns, include sterilisation of domestic animals and

This invention describes a novel fusion protein, comprising a heat shock CC protein (e.g. ubiquitin), fused to an epitope(s) in a defined manner which is useful for the stimulation of a highly specific immune response CC which is useful for the stimulation of a highly specific immune response CC when administered to an animal. The protein of the invention may be const-translationally modified (e.g. by the addition of fatty acids to enhance immunogenicity). The fusion proteins of the invention can be used as vaccines to induce an immune response. When a T cell epitope is a trached, they can be used for control of viral infections, bacterial CC infections, parasitic infection and cancer. The fusion proteins can be used in pharmaceutical compositions for the treatment of gastrointestinal CC infections. The use of ubiquitin as a scaffold is also useful for the presentation and stimulation of anti-self immune responses, e.g. Generation of anti-gonadotropin releasing hormone antibodies which result in the suppression of luteinizing hormone and follicle stimulating to hormone. This indirectly suppresses steridogenesis and gamete maturation cc in males and females. This type of anti-self response in humans is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ġ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ω
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cc in the treatment of prostate cancer and breast cancer. In livestock, the cability to stimulate an anti-self response provides a simple alternative cc to physical castration. Immunocastration of pigs is a better alternative cc to physical castration, as it does not result in any of the detrimental cc side effects associated with physical castration. Other examples of confisces and conditions treated with self proteins fused with ubiquitin cc are Tur and its epitopes to modulate septic shock, arthritis, if confident confisces to control of allergic reactions; chorionic cc position heavy chain for the control of allergic reactions; chorionic cc control. A further use of the fusion proteins is as part of a vaccine to control. A further use of the fusion proteins is as part of a vaccine to shipment to market. In addition, the fusion proteins of the invention cc can be used to detect and identify antibodies from experimental samples. This sequence represents a GnRH fragment used in the construction of a ubiquitin fusion protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

```

This invention describes a novel fusion protein, comprising a heat sl protein (e.g. ubiquitin), fused to an epitope(s) in a defined manner which is useful for the stimulation of a highly specific immune respondent administered to an animal. The protein of the invention may be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  IJ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            control. A further use of the fusion proteins is as part of control. A further use of the shance growth rate and thereby the final head of the shance growth and thereby the shance growth and the self response in humans is useful the physical castration. Immunocastration of pigs is a better alternative to physical castration. Immunocastration of pigs is a better alternative to physical castration, as it does not result in any of the detrimental conditions treated with physical castration. Other examples of the deficit associated with physical castration. Other examples of the diseases and conditions treated with self proteins fused with ubiquitin are TNF and its epitopes to modulate septic shock, arthritis. If the control of allergic reactions; chorionic growth protein for the control, and sperm proteins for fertility control. A further use of the fusion proteins is as part of a vaccine to enhance growth rate and thereby the final weight of the livestock prior to shipment to market. In addition, the fusion proteins of the invention of this sequence represents a GNRH fragment used in the construction of the ubiquitin fusion protein described in the construction of the construction of the subiquition the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

They can also be used for inhibiting the growth of cells which are regulated directly or indirectly by LHRH, e.g. malignant breast cells, malignant prostate cells or malignant oncofoetal cells or hyperplastic cells. They can also be used for down-regulating the libido of an animal. They can also be used for inhibiting pregnancy, prostate enlargement, endometriosis or inflammatory responses. The LHRH compositions induce a more effective immune response against LHRH than the LHRH-carrier-adjuvant compositions. The effective immune response against LHRH than the HRH results in prevention of the release of the hormones LH and FSH from the anterior pituitary. Sequences W34890-93 are peptide derivatives of LHRH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates immunogenic composition for eliciting an immune response to luteinising hormone releasing hormone (LHRH). The composition comprises a LHRH-diphtheria toxold (DT) conjugate adsorbed to an ionic polysaccharide. The LHRH-DT compositions can be used for eliciting an immune response to LHRH, for castrating an animal, for regulating oestrus cycling in a female animal or for inhibiting characteristics induced by the sexual maturation of an animal, e.g. aggression or sexual activity. They can also be used for achieving production gains in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New immunogenic leutenising hormone releasing hormone compositions comprise LHRH conjugated to diphtheria toxoid and adsorbed to an ionic polysaccharide, used to inhibit reproductive function in animals

                                                                                                                                                                                                                                                                                                                           The inventors claim a compsn. for the redn. or prevention of undesired prostatic growth in males. The compsn. contains a decapeptide (gonadorelin) (P10097) with an appropriate vehicle or support. The compsn. is used for treating e.g. benign prostatic hyperplasia by parenteral admin. in daily doses of 0.035-11.0 (pref. 0.080-2.0) mg/kg. Gonadorelin is the generic name for LH-RH and is described in US3835108. In the example s.c. injection of the compsn.significantly reduced the wt. of seminal vesicles and ventral prostate in rats without affecting the wt. of the

                  A synthetic DNA sequence (T37178) codes for a gonadotropin releasing hormone (GnRH) tetramer (W03944), in which the 4 GnRH repeat units are separated by spacers designed to increase immunogenicity. The DNA sequence was incoporated into vector pAA352 (ATCC 68283), which contains a truncated leukotoxin gene (LKT 352) derived from Pasteurella haemolytica, to give plasmid pCB113 (T37176). Escherichia coli transformants produce an LKT-GnRH fusion protein (see also W03942 and W03943) useful as a vaccine for fertility control of domestic or farm ar
                                                                                                                                        Gonadotropin-releasing hormone multimer fusion proteins - with leukotoxin polypeptide for increased immunogenicity, useful in antifertility vaccine prodn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Leukotoxin; LKT; gonadotropin-releasing hormone; GnRH; fusion protein; immunogen; vaccine; fertility control; contraceptive; sterilisation; pCB113; pCB111.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GnRH 4-repeat sequence

The present sequence represents a recombinantly produced or chemically synthesised Gonadotropin releasing hormone-2 (GnHR-2) polypeptide, which contains four copies of the GnHR decapeptide (VG1528) and triplet amino acid spacers between each of these sequences. This decapeptide is secreted naturally by the hypothalamus which controls release of both the luteinising hormone (LH) and the follicle stimulating hormone (FSH) in vertebrates. This sequence, as compared to the native peptide, has been found to have an N-terminal Gln rather than a pyroGlu residue, and also contains substitutions at amino acid residues 15 and 41, whereby His is replaced by Asp. This produces an alternating multimeric GnRH sequence which is highly immunogenic that can be used in the construction of a chimeric protein that comprises a leukotoxin polypeptide, several

AA;

or to elicit an immune response against a targeted endogenous cell type (e.g. a cancerous or otherwise diseased cell). It is especially useful to reduce the levels of GnRH in domestic animals, especially in porcine or bovine species. The use of GnRH immunogens in the vaccine reduces the levels of luteinizing hormone and follicle stimulating hormone and helps in immunocastrating the animal. Administration of vaccine compositions to the ear instead of intramuscular administration into the neck increases the efficiency of vaccination of mammals against endogenous immunogens, and may increase uniformity of vaccine presentation since the ear is

invention of immunisation against endogenous molecules by administering a vaccine which comprises an immunogen and a carrier to the ear of the mammal. The method is useful for eliciting an efficient and uniform immune response to block or suppress the activity of an endogenous hormone, hormone receptor, agonist or antagonist in a vaccinated subject,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            alignment_scores:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC The invention relates to GnRH immunogens, analogues or antibodies
CC that cross-react with endogenous GnRH of a vertebrate. A specifically
CC claimed immunogenic fusion protein (Y58361) comprises, in the N to
CC C-terminal direction, a synthetic peptide sequence (Y58364), an eight
CC copy GnRH multimer (composed of two copies of the 4xGnRH multimer
CC sequence of Y58363), the LKT protein (which functions as a carrier
CC sequence) of Y58363), the LKT protein (which functions as a carrier
CC sequence) of Y58363), the LKT protein (which functions as a carrier
CC sequence) of Y58363), the LKT protein (which functions as a carrier
CC sequence of Y58363), the LKT protein (which functions as a carrier
CC sequence of Y58363), the LKT protein (which functions as a carrier
CC sequence of Y58363), the LKT protein (which function may
CC vertebrate subject to result in prolonged suppression of reproductive
CC behaviour and/or fertility, GnRH immunogens, analogues or antibodies are
CC used to manufacture a composition or vaccine for immunosterilisation or
CC immunocontraception of feline, canine, equine or cervine subjects.
CC The vaccines are used to suppress reproductive behaviour and/or
CC results in a prolonged, long-term suppression of testicular development
CC covarian development and/or function in females. The methods provide a
CC viable and desirable alternative to surgical forms of sterilisation that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Align seg 1/1 to: Y58363
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     US-09-306-689-10 x Y58363
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Percent Similarity:

This fusion gene encodes a GRH-LEW fusion CC fusion gene (Z46400). This fusion gene encodes a GRH-LEW fusion CC retains which may be used as a vaccine. The LKT portion of the protein CC relates to a method of using two GRH immunogen vaccines to produce curcastrated male animals for meat production, one vaccination prior to CC or during the fattening period to reduce circulating testosterone levels, and the second vaccination about 2-8 weeks before slaughter to CC and the second vaccination about 2-8 weeks before slaughter to CC substantially reduce androgenic and/or non-androgenic steroids. The CC invention is used to produce food animals that exhibit the weight gain CC associated with male animals. Such problems include "boar taint", a CC caused by steroids stored in the tissues, and similar flavour impairments in the meat of other intact male animals. The invention is

It is the product of a chineric gene (T37177) produced by deleting an approx. 1300 bp sequence from pcB113 (see also T37176) coding for amino acids 352-784 of LKT-352. Recombinant plasmid pcB111 (LKT 111:4 copy GnRH, ATCC 69748) was obtd. Escherichia coli transformants produced the chimeric protein, which is useful as a vaccine for fertility control, esp. immunological sterilisation of domestic or farm

optimal immune response.

optimal immune response.

truncated LKT to be expressed at much may be truncated LKT to be expressed at much may be truncated LKT to be expressed. This chimeric particle of antigen administered to be reduced. This chimeric particle particle is chimeric particle of the incidence of mammalian individual.
                                                                                                                                                                                                                                                                                                                                                                                                                  which enables there to be an increase in antigen presentation and thus an optimal immune response. The removal of this region also enables the truncated LKT to be expressed at much higher levels and allows the amount of antigen administered to be reduced. This chimeric protein comprises a leukotoxin polypeptide, several multimers, and a GnRH sequence. The

                                                                                                                                                                                                                                            vertebrate subject to result in prolonged suppression of reproductive behaviour and/or fertility. GnFH immunogens, analogues or antibodies that cross-react with endogenous GnRH of a vertebrate subject are used to manufacture a composition or vaccine for immunosterilisation or immunocontraception of feline, canine, equine or cervine subjects. The vaccines are used to suppress reproductive behaviour and/or fertility for at least 10 months. The prepubertal administration results in a prolonged, long-term suppression of testicular development
                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a fusion protein comprising gonadotropin-releasing hormone (GNRH) immunogens and a Pasteurella haemolytica leukotoxin (LKT) protein. The fusion protein comprises, in the N to C-terminal direction, a synthetic peptide sequence (Y58364), are eight copy GNRH multimer (composed of two copies of the 4xGNRH multimer sequence of Y58363), the LKT protein (which functions as a carrier protein), and a second eight copy GNRH multimer. The fusion protein may be used in a vaccine composition for prepubertal administration to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    101
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chimeric - Mammalia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Y58361
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    04-JUN-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US-09-306-689-10 x Y58361
                                                                                                                                                                                  and the second vaccination about 2-8 weeks before slaughter to substantially reduce androgenic and/or non-androgenic steroids. The invention is used to produce food animals that exhibit the weight gain and muscle/fat distribution of male animals without the problems associated with male animals. Such problems include "boar taint", a urine-like odour found in cooked meat of uncastrated pigs which is
                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a chimeric gonadotropin releasing hormone (GARH)-leukotoxin (LKT) fusion protein, which may be used as a vaccine. The LKT portion of the protein acts to enhance the immunogenicity of the multimeric GARH portion (Y58135). The invention relates to a method of using two GARH immunogen vaccines to produce uncastrated male animals for meat production, one vaccination prior to
                                                                                                               caused by steroids stored in the tissues, and similar flavour impairments in the meat of other intact male animals. The invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antibody; immunogenic; chimeric; vaccine; testosterone; androgenic; non-androgenic; steroid; reduction; weight gain; muscle distribution; fat distribution; male pattern; boar taint; flavour; impairment;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gonadotropin releasing hormone; GnRH; leukotoxin; LKT; fusion protein; antibody; immunogenic; chimeric; vaccine; testosterone; androgenic;
                                                                                                                                                                                                                                                                                                                                                                                                      or during the fattening period to reduce circulating testosterone levels,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Production of uncastrated male food animals using vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      101 GCCCTGGCAGCGGTAGCCAAGATTGGAGCTACGGCCTGCGTCCGGGT 147

A chimeric protein (W03942) is composed of a fusion between a truncated leukotoxin (LKT-352) from Pasteurella haemolytica (see also W03945) and a 4-copy gonadoliberin-releasing hormone (GnRH) repeat sequence (see also W03944). It is the product of a
                                                                                 Gonadotropin-releasing hormone multimer fusion proteins - with leukotoxin polypeptide for increased immunogenicity, useful in antifertility vaccine prodn.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   chimeric gene (T37176) produced by ligating a synthetic sequence for the 4-copy GnRH into vector pAA352 (ATCC 68283), which carries the LKT-352 gene. Recombinant plasmid pCB113 (LKT-3524 copy GnRH, ATCC 69749) was obtd. Escherichia coli transformants produced the chimeric protein, which is useful as a vaccine for fertility control, esp. immunological sterilisation of domestic or farm animals.

which enables there to be an increase in antigen presentation and thus an optimal immune response. The removal of this region also enables the truncated LKT to be expressed at much higher levels and allows the amount of antigen administered to be reduced. This chimeric protein comprises a

four copies of the GnRH peptide.

This chimera lacks cytotoxic activity

The fusion proteins can be considered in pharmaceutical compositions for the treatment of gastrointestinal cdiseases, pulmonary inflections, respiratory inflections, and HIV confections. The use of ubiquitin as a scaffold is also useful for the conservation of anti-gonadotropin releasing hormone antibodies which result in the suppression of luteinizing hormone and follicle stimulating confined in the treatment of prostate cancer and breast cancer. In livestock, the confined effects associated with physical castration, as it does not result in any of the detrimental confiderates and conditions treated with self proteins fused with ubiquitin care TNF and its epitopes to modulate septic shock, arthritis, control. A further use of the fusion proteins is as part of a vaccine to shipment to market. In addition, the fusion proteins of the invention construction of confideration for the fusion proteins is as part of a vaccine to control. A further use of the fusion proteins is as part of a vaccine to can be used to detect and identify antibodies from experimental samples. This sequence represents a GRRH fragment used in the construction of construction construction constru

The protein of the invention may be post-translationally modified (e.g. by the addition of fatty acids to enhance immunogenicity). The fusion proteins of the invention can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC used as vaccines to induce an immune response. When a T cell epitope is attached, they can be used for control of viral infections, bacterial confections, parasitic infections and cancer. The fusion proteins can be used in pharmaceutical compositions for the treatment of gastrointestinal confections. The use of ubiquitin as a scaffold is also useful for the presentation and stimulation of anti-self immune responses, e.g. cc presentation and stimulation of anti-self immune responses, e.g. cc presentation and stimulation for the suppression of luteinizing hormone antibodies which result in the suppression of luteinizing hormone antibodies which result in the suppression of luteinizing hormone and follicle stimulating commone. This indirectly suppresses steridogenesis and gamete maturation in males and females. This type of anti-self response in humans is useful continued to the treatment of prostate cancer and breast cancer. In livestock, the ability to stimulate an anti-self response provides a simple alternative to physical castration. Immunocastration of pigs is a better alternative to physical castration, as it does not result in any of the detrimental conditions treated with physical castration. Other examples of diseases and conditions treated with self proteins fused with ubiquitin are TWF and its epitopes to modulate septic shock, arthritis, cc proteins for fertility control; and sperm proteins for fertility control. A further use of the fusion proteins is as part of a vaccine to cenhance growth rate and thereby the final weight of the livestock prior to the market in addition, the fusion proteins for fertility.

The protein of the invention may be post-translationally modified (e.g. by the addition of fatty acids to enhance immunogenicity). The fusion proteins of the invention can be a considered to the invention of the invention of the invention of the invention can be a considered to the invention of the inv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   immune response stimulation; vaccine; T cell; viral; infection; cancer; bacterial; parasitic; treatment; gastrointestinal disease; HIV infection; pulmonary inflection; respiratory inflection; scaffold; anti-self; pig; steridogenesis; gamete maturation; prostate; breast; castration; TNF; tumour necrosis factor; septic shock; arthritis; Crohn's disease; inflammatory bowel disease; ulcerative colitis; chorionic gonadotropin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        to shipment to market. In addition, the fusion proteins of the invention can be used to detect and identify antibodies from experimental samples. This sequence represents a GRRH fragment used in the construction of a ubiquitin fusion protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 81; Page 43; 67pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         seq_name: /SIDS1/gcgdata/geneseq/geneseqp/AA1991.DAT:R11187
                                                                 Plasmid pBTA859 is a TraTp-LHRH analogue fusion in which 8 copies of an LHRH analogue have been inserted between amino acids 200 and 201 of TraTp (Ogata R.T. et al., (1982) J.Bacteriol. 151:819-827). The plasmid was constructed by two successive additions of DNA coding for a dimer of LHRH analogue into the Smal site of pBTA862 (see Q11020) which all ready carries four copies of the LHRH sequence. After transformation, colonies with B LHRH molecules were identified. Fusion proteins with multiple inserts generated a higher anti-LHRH response (as measured by the binding of (125)I-LHRH at a serum dilution of 1:2000 final) than constructs with a single
